

SOLID STATE POWER

Solid State Power (Pty) Ltd was registered in May 2008 as a joint venture company between its founders and The Bidvest Group. Within a relatively short time, Solid State Power has developed and manufactured a local range of innovative products to become a leading supplier to the private and public sectors in energy saving and alternative energy products and solutions.

The energy crisis in South Africa and the power shortage has created a growing demand for Solid State Power products and plans are afoot to expand the local manufacturing arm of the business.

The wide range of products fall under different energy efficient categories, which can save up to 80% energy in the correct environment, such as its unique solar geysers, digital temperature controllers for geysers, air conditioning controllers, solar lighting units, Uninterrupted Power Systems (UPS) and a large range of LED light sources and fixtures. Solid State Power's SOLO integrated geyser is a unique and patented product that produces low pressure and is a non-electrical geyser that is ideal for low-cost housing or for replacing or enhancing existing electrical geyser structures, under certain conditions.
